Ocean observation Systems

Establishment of
Ocean Observation Systems
 in 1997 by
National Institute of Ocean Technology
 ESSO - Ministry of Earth Sciences
 Government of India

- ❖ **Data buoys provides Systematic time-series surface meteorological and oceanographic observations.**
- ❖ **Special underwater, marine and meteorological observational capability required to improve Oceanographic services and predictive capability of short and long-term climate changes.**
- ❖ **Provides critical information on hazards like Cyclones, Tsunami & Sea Level rise**

Calibration Test Facility

- ✚ Established Parameters -
 - ✚ Atmospheric pressure,
 - ✚ Atmospheric temperature,
 - ✚ Atmospheric humidity,
 - ✚ Precipitation,
 - ✚ ADC (CPU) –analog channels
 - ✚ Compass (ADCP)
- ✓ Calibration before the deployment and after retrieval for quality data
- ✓ WMO recommended (RIC) reference standard are used
- ✓ Reference standard are having traceability with NPL, New Delhi.
- ✓ International interaction with M/s PMEL, USA and CSIRO Australia

Sensors name	Calibrated OEM/In house	Equipment needed for calibration	Proposed plan	Approximate cost to establish the calibration facility(in lakhs)
Air Pressure sensor	In house	Gas piston gauge (DWT)	Completed	--
Air temperature and humidity sensor	In house	Chilled mirror and PRT with AT and AH generator	Completed	--
Precipitation sensor	In house	Flow bench	Completed	--
DP CPU	In house	Digital source and <u>multimeter</u>	Completed	--
ADCP Compass and Digital compass in the buoy	In house	Turn table	Completed	--
PSP (precision spectral pyranometers)	OEM	Standard Precision Pyranometer (SPP) with radiation source Ref: ISO 9847 - calibration of field pyranometers by comparison to a reference pyranometer	Will try to Utilize IMD facility	
CT(SMP/IM/IMP)	OEM	High stable temperature bath and reference sensor	FLUKE/CSIRO/SEABIRD/RBR	200
PIR (precision infrared radiometer)	OEM	Transfer standard with reference PIR sensor and blackbody source	Will try to Utilize IMD facility

Data Reception Facility

CORNEA - Centre for Ocean Realtime iNformation viEw and Archives

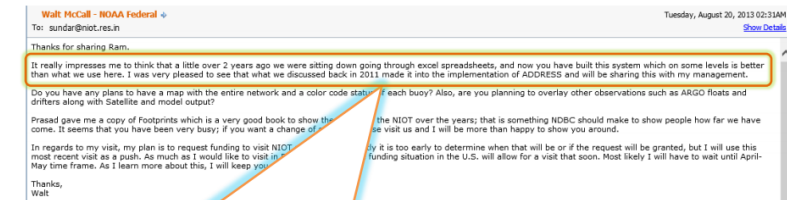

- Holds 3.7 crores of data records since 1997
- Real time data analysis
- Automated QC control
- Global Tier II Data Centre standards
- 24x7 operation
- Multi-level redundancy in terms of cooling, power, IT hardware and Application.
- High-end 4x3 Matrix Video Wall & Conferencing system to enable multi-window projection and wireless presentations to have better insight to data.
- Automatic alert on buoy movement due to drift
- Inventory management

ADDRESS – Data Reception and Analysis tool

Appreciation from NDBC

It really impresses me to think that a little over 2 years ago we were sitting down going through excel spreadsheets, and now you have built this **system** which is on some levels **is better than what we use here**. I was very pleased to see that what we discussed back in 2011 made it into implementation of ADDRESS and will be sharing this with my management.

OMNI Buoys

Under the Ocean Observation Network (OON) programme of Ministry of Earth Sciences (MoES, Govt. of India), the Ocean Observation Systems (OOS) group of NIOT is entrusted to establish a moored buoy network in the Indian Ocean. The OOS group, erstwhile National Data Buoy Programme, was established in 1996, with the objective to operate, maintain and develop moored buoy observational networks and related telecommunication facilities in the Indian seas. From 2012 onwards, an advanced type of buoy technology was implemented by OOS-NIOT and these improved moored buoys are called OMNI (Ocean Moored buoy Network for Northern Indian) buoys. At any given time, around 12 OMNI buoys collect and transmit high resolution real-time upper ocean (such as vertical profiles of temperature,

MoU Signing Ceremony

Dr. Ashutosh Sharma, Secretary MoES launched the portal in the presence of Mr. Craig McLean, Assistant Administrator for Research and Acting Chief Scientist of NOAA on 09th August 2021.

All moored buoy data outside the EEZ are shared to the public are being shared in this joint portal.

METADATA

Moored buoy Data availability from 1997 to 2022

ADCP Configuration

- Acoustic Doppler Current Profiler
- Measures wave and current velocities and direction through the specified water column using an acoustic signal
- Eulerian system (measures at one point over time)
- ADCP model : TELEDYNE Workhorse Quartermaster (75 KHz & 150 KHz)
- Deployed at 15 m depth
- Resolution: 0.5 m
- Recording interval data: 1 ping/3 sec x 60 samples
- Total bins: 40 and
- Each bin size: 5m

Classic and reverse diel migration

In the classic diel vertical migration pattern (yellow arrows), zooplankton such as marine worms (yellow) travel to the surface to feed at night when predators such as fish are absent. A reverse nightly migration (gray arrows) takes smaller zooplankton such as copepods to the deep, where they can avoid becoming the worms' prey.

Diurnal Vertical Migration (DVM) in AS

- DVM is a pattern of movement used by some organisms to shallower/deeper depths during day/night.
- The vertical migration depends on the presence of light, predators, feeding strategy, phytoplankton abundance etc.
- The ADCP measurements in central Arabian Sea captured DVM
- Period : October 2013 to April 2014 , depth range is >150m

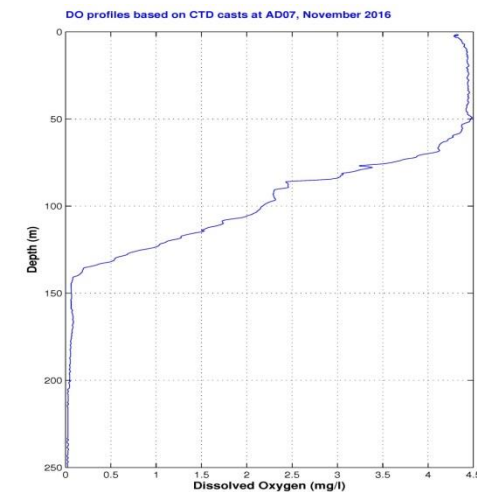

- The concentration of scatterers affects range because more scatterers reflect more sound.
- The dominant oceanic sound scatterer at ADCP frequencies is zooplankton with sizes on the order of one mm.
- Other scatterers can include suspended sediment, detritus, and density gradients.

Diurnal Vertical Migration (DVM) in AS

- The scatters migrate to shallower depth during Night time
- They remain at deeper depths during day time
- It is observed that the scatterers travel the 100m distance in ~2hours

- The analysis of Dissolved oxygen and Chlorophyll-a indicates the presence of phytoplankton and hence the scatterers in the upper 150m.

Diurnal Vertical Migration (DVM) in AS

- The distribution of depth which varies with lunar phase indicates the significance of light as a triggering mechanism.

Lunar Phase

- The seasonal variability observed in DVM indicates the significance of light as a triggering mechanism.

DATA SET: INDARC_ADCP.csv

Conclusion

- ADCP measures the currents with the help of scatterers (zooplankton) with sizes on the order of one millimeter.
- Density of the zooplankton in the entire water column is not uniform and has higher concentration near the surface.
- The DVM is exhibited by the zooplankton to escape from predators.
- We also reveal marked DVM, with timing closely associated with the day-night light cycle—descent from the photic zone 1–2 h before sunrise, and reappearance in the near-surface about 1–2 h after sunset.
- The zooplankton descends to deeper waters and resurfaces during the night.
- Echo intensity measured by the ADCP from the scatterers shows large diurnal variation due to DVM.
- The migration consists of two distinct layers—a shallower layer reaching the interface level (~140 m) and a deep layer which descends to 240 m.

Thank you
