# The Lagrangian Drifter Lab

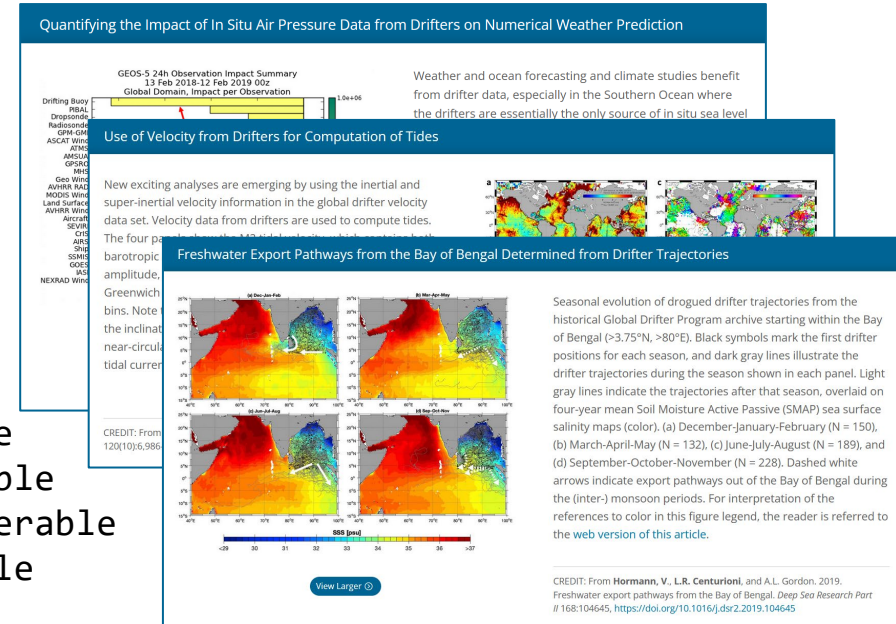

Director: Dr. Luca Centurioni, PI of the Global Drifter Program

The Lagrangian Drifter Laboratory (LDL) is a team of Scientists, Engineers, Technicians, Coordinators and external collaborators in support of the end-to-end use of Lagrangian Drifter Technology and for promoting the advancement of air-sea interaction science (1,200+ paper published resulting from the FAIR-O data approach)

## ACTIVITIES

Generation of scientific publications and products; Scientific advancements and applied science

- Development of new and existing drifter technologies
- Organization of scientific field campaigns
- Data management and analysis
- Peer-reviewed publications with associated DOI and FAIR-O ERDDAP dataset.

Findable  
Accessible  
Interoperable  
Re-usable  
Open

## SURFACE VELOCITY PROGRAM BAROMETER (SVPB) DRIFTER

### Technical Description

- 35 cm sphere surface float
- GPS-based tracking
- Iridium Short Burst Data (SBD) telemetry
- Sea surface temperature ( $\pm 0.05$  K accuracy)
- Sea level barometric pressure sensor ( $\pm 0.4$  hPa accuracy)
- Holey sock drogue centered at 15 m depth
- Variable sampling rate down to 5 minutes
- Two-year lifespan

> Download technical illustration (312 KB pdf)

## DIRECTIONAL WAVE SPECTRA BAROMETER DRIFTER (DWSBD)™

### Technical Description

- 35 cm sphere surface float
- GPS-based tracking and wave engine
- Iridium Short Burst Data (SBD) telemetry
- Onboard datalogger with up to 16 GB of storage
- Fourier coefficients  $a_0, a_1, b_1, a_2, b_2$
- 1/256 Hz bandwidth from 0.03–0.50 Hz
- Sea level barometric pressure sensor ( $\pm 0.4$  hPa accuracy)
- User-programmable sampling window
- Sea surface temperature ( $\pm 0.05$ °C accuracy)
- Freely drifting or restrained mooring configurations
- One-year lifespan

> Download technical illustration (312 KB pdf)  
> Download data sheet (657 KB pdf)

# Platform Metadata

The LDL aggregates detailed hardware and platform metadata, inclusive of WIGOS specification metadata, for platforms under management using both Human and Machine-to-Machine (M2M) interfaces.

These metadata are an essential component to providing real-time data with traceable records and quality control for downstream users. Expanded metadata tracking provides additional context layers of a platform's life, including age, storage location and point of contact, and availability for a port of call.

## ACTIVITIES

- Version-2 Specification Sheet with web form and M2M RESTful API
- Expanded Metadata tracking including platform registration, shipment/warehouse tracking and digital deployment submission (QR code)
- Aggregation and push into OceanOPS via their M2M RESTful API in support of FAIR-O commitment
  - Platform registration, deployment and WMO request – *testing underway*
  - WIGOS metadata via OceanOPS API or XML/JSON submission – *anticipated in 2023*

The image shows a web form for entering metadata for a Drogue instrument. The form is layered over other instrument types like GPS, Sea Surface Temperature, Barometer, and Construction. The Drogue form includes fields for Center Depth (15), Wheel (2020 - Injection Mol), Wheel Material (Recycled ABS), Material (600 Denier Cordura), Overall Length (7.5), Sections (5), Diameter (0.61), and Ballast Weight (1.8). Below these is an 'Instrument and Methods of Observation' section with fields for Measurement/observing method (Strain Gauge), Accuracy, Range (0, 60), Vertical distance of sensor (-18.4), Configuration of instrumentation, Instrument Manufacturer and Model (Omega SGD-3/350), Serial Number, and Exposure of Instrument (class3).

Metadata web form with underlying RESTful API for Machine-to-Machine (M2M) efficiency

# Satellite Airtime Management

The LDL has direct access to Iridium configurations enabling granular control of platforms under management.

Integrated management in collaboration with partners, who inform LDL of issues in real-time, from hardware fabrication to FAIR-O datasets with associated DOI, ensures traceability and troubleshooting of spurious issues stemming from drifter technologies or their data.

## ACTIVITIES

- Scheduling of the activation, suspend, and deactivation of platforms from system checkout at the manufacturer facility to preparation for deployment and finally, deactivation at end of life.
- Real-time monitoring of platform performances with consideration to available airtime budget and current expenditure
- API (M2M) configuration of platform airtime
- Tight coupling of Metadata in support of Real-time Data management and distribution

## TRACKING

| Platform-ID     | Date       | Type      | Location                                                     | Carrier   | Contact Name  | Contact Email     | Comment                                                    |
|-----------------|------------|-----------|--------------------------------------------------------------|-----------|---------------|-------------------|------------------------------------------------------------|
| 300534061651010 | 2022-08-09 | receiving | 10th Avenue Marine Terminal, Crosby Road, San Diego, CA, USA | LDL Truck | Kelsey Vogel  | kdvogel@ucsd.edu  | delivered directly to R/V Bold Horizon                     |
| 300534061651010 | 2022-08-09 | shipping  | Nori, Downwind Way, La Jolla, CA, USA                        | LDL Truck | Lucia Bertero | lbertero@ucsd.edu | Delivered by LDL in wire cages directly to deployment ship |

## REGISTRATION AND IRIDIUM ACTIVATION

Streamlined airtime management leading to cost savings without sacrifice of quality for the end user!

Scripps Institution of Oceanography's

**LAGRANGIAN DRIFTER LABORATORY**

# Tools: Adaptive Sampling Engine

The LDL developed capabilities to enable adaptive sampling based on scheduled and algorithmic inputs.

Such capabilities include the ability to convert an SVPB into a DWSB drifter, as performed under Hurricane Sam in 2021, and ability to disable onboard sensors to conserve power and data transmission budgets as performed in the 2022 Hurricane season, for example, using an ADWS drifter deployed under TD One and placed into low power mode (6hr location, waves disabled) until the arrival of Hurricane Ian ~4 months later.

## ACTIVITIES

- Algorithmic event detection based on runtime configuration for real-time monitoring
- Selective high-resolution sampling, variable sensor sampling and configuration providing power and airtime savings
- Ability to assess quality control based on sensor monitoring anomaly detection

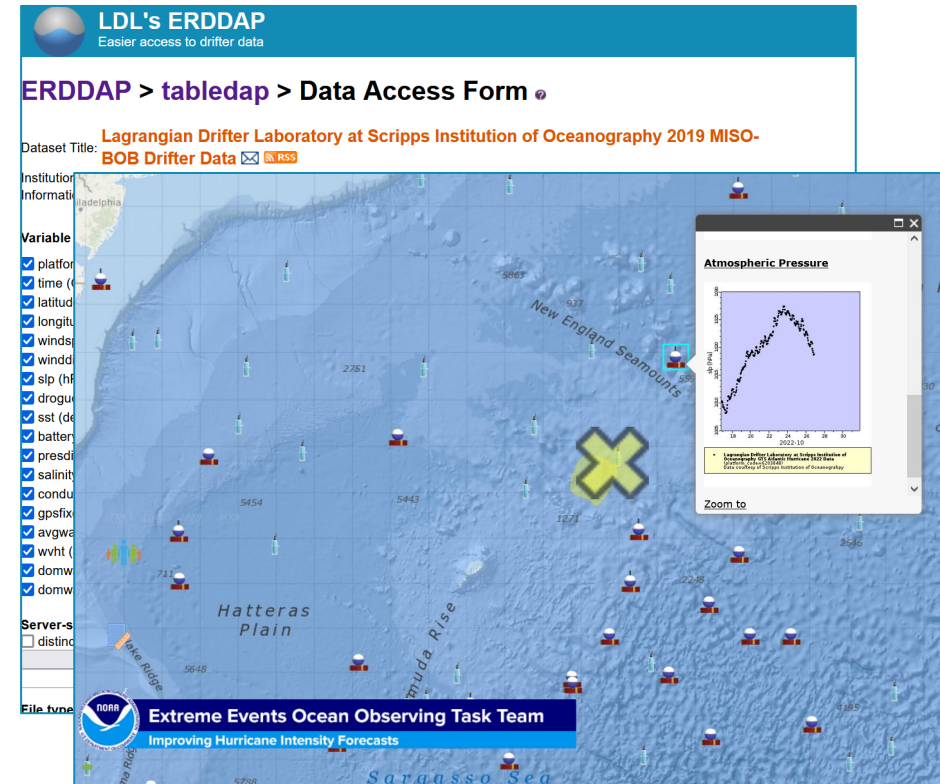

# Products: API, GTS, ERDDAP, and Beyond!

The LDL produces various data products using real-time and historical data for end-users. LDL Data products are made available in a variety of formats in support of FAIR-O data commitment.

Tight coupling of data with applied partner QC for GTS processing enables multiple access points for real-time and historical drifter data.

## ACTIVITIES

- Over 1,250 drifters posted daily onto GTS under IOBX02 KWBC and IOWX02 KWBC in BUFR TM315009
- GUI websites and M2M RESTful API for direct data access
- Alternate formats such as Google Earth KML and KMZ with link back to ERDDAP made available for specific applications.
- ERDDAP datasets with associated DOI and publications for scientific community

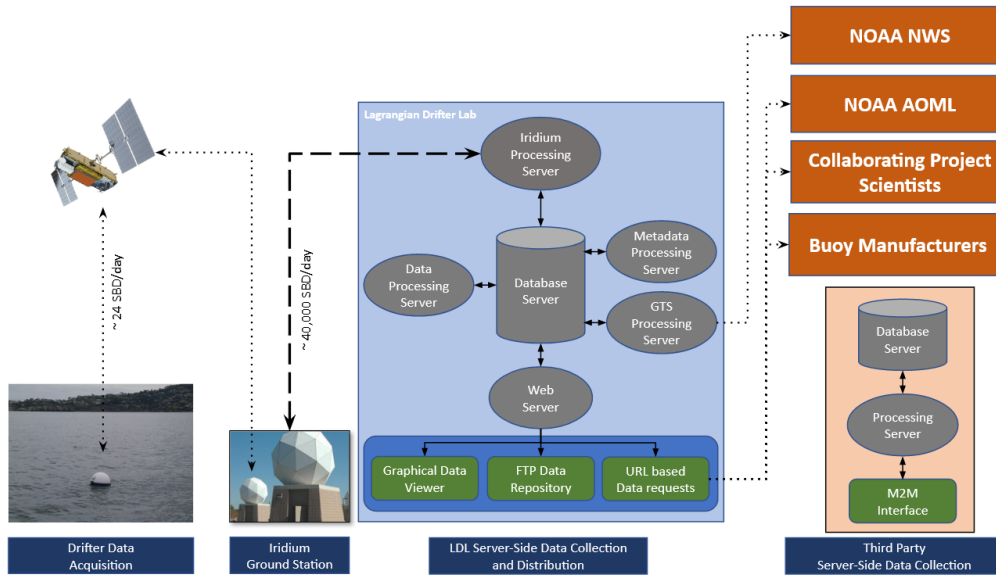

- LDL ERDDAP Data Access Portal of science driven dataset with accompanying publication (DOI available shortly)
- Real-Time LDL KML for NOAA GeoCollaborate Dashboard with associated ERDDAP plots and data access for GTS quality-controlled sensor data
