

The Global Ocean Observing System

Version: 2.0 April 2025

## Essential Ocean Variable Specification Sheet

# Coral Cover and Composition

Global Ocean Observing System (2024). Essential Ocean Variable Specification Sheet: Coral cover and composition. GOOS Reference No; DOI: [to be assigned]

EOV Specification Sheet curated by:

Biology and Ecosystems Panel

The Global Ocean Observing System

**DETAILED INFORMATION ON HOW TO READ THE SPECIFICATION SHEET CAN BE FOUND IN THIS [GUIDE](#)**

## Background and justification

Corals span shallow tropical waters to deep-sea environments, forming biodiverse reefs of immense ecological and economic importance. As ecosystem engineers, hard corals (Scleractinia, Styliasteridae), soft corals (Octocorallia), and sponges create biogenic habitats that support 25% of marine species while sustaining fisheries worth 6.8 billion annually (Souster et al., 2021). These ecosystems provide coastal protection, novel pharmaceuticals, and contribute 375 billion yearly to the global economy, including 36 billion from reef tourism.

Despite their value, corals are exceptionally vulnerable due to slow growth rates and sensitivity to environmental changes. Climate change threatens 70-90% of shallow reefs with extinction by 2050 (IPCC), while degraded reefs could expose 63 million more people to annual flooding by 2100 (IPCC). Additional pressures include ocean acidification, pollution, and destructive practices like deep-sea mining, which risks irreversible damage to 4,000-year-old deep sea coral colonies (NOAA, 2021).

Monitoring these ecosystems requires specialized approaches: shallow-water corals (0-30m) are studied via SCUBA surveys assessing live cover, bleaching, and recruitment, while deep-sea corals (>200m) demand advanced technologies like ROVs, AUVs, and seabed mapping to evaluate Vulnerable Marine Ecosystems (VMEs). Ongoing research integrates these methods - combining eDNA analysis, high-resolution imaging, and terrain mapping - to develop comprehensive conservation strategies for coral communities worldwide.

### Integration with Global Observation Frameworks

The Global Climate Observing System (GCOS) developed the Essential Climate Variable (ECV) framework to define necessary observations for monitoring Earth's climate (Bojinski et al., 2014). Some EOVs, including ocean physics, biogeochemistry, and biology/ecosystems variables (GCOS, 2022a; GCOS, 2022b), are also ECVs.

The Essential Biodiversity Variables (EBVs) defined and curated by the Group on Earth Observations Biodiversity Observation Network (GEO BON) complement the GOOS biological and ecosystem (BioEco) EOVs (Muller-Karger et al., 2018; Bax et al., 2019). The EOVs represent the basic observations of a particular parameter or process. EBVs are time series of biodiversity observations across genes, species populations, communities, or ecosystems. Thus, EOVs may be seen as the building blocks for GEO BON EBVs. The EOVs can be used to synthesise the EBVs as time series of BioEco EOV sub-variables at one location, or as time series of gridded, mapped, or modelled EOVs (Jetz et al., 2019).

The Coral Cover and Composition EOV contributes to both ECVs and EBVs, as well as to many indicators used for policy and assessment (Obura et al. 2019), providing critical data for understanding and managing marine ecosystems over short periods to climate time scales. The GOOS Biology and Ecosystems Panel collaborates with the Physics and Climate and Biogeochemistry Panels to advance EOVs, advocating for the need for biological observations, information management, and applications. GOOS, MBON, GEO BON, and OBIS work together to standardise guidelines and data management for EOVs, EBVs, and ECVs.

### Current observing networks and coordination

**Diverse networks and communities are collecting observations of biology and ecosystems EOVs at different scales and in different regions. An initial baseline survey conducted in 2019/20 identified 203 active, long-term (>5 years) observing programs systematically sampling marine life. These programs spanned about 7% of the ocean surface area, mostly concentrated in coastal regions of the United States, Canada, Europe, and Australia (Satterthwaite et al 2021). This information can be found in the GOOS BioEco Metadata Portal, which is continually updated. To consult the latest information, please visit: <https://bioeco.goocean.org>**

# 1. EOV information

## ESSENTIAL OCEAN VARIABLE (EOV)

### Coral cover and composition

## DEFINITION

For the purpose of this EOV, corals encompass both warm-water species generally found in tropical regions and accessible by SCUBA (0–30 m), and cold-water species inhabiting mesophotic to deep-sea waters (>30 m) in tropical, temperate, and polar settings—where advanced monitoring methods (e.g., technical diving, ROVs, AUVs, towed camera systems, benthic landers, and crewed submersibles) become necessary (>200m). Corals are further subdivided into hard corals (Scleractinia, Stylasteridae) and soft corals (Octocorallia), accommodating their distinct morphologies and ecological functions.

## EOV SUB-VARIABLES

**Coral condition and health** (e.g., bleaching, disease, mortality, disturbance)  
**Coral diversity** (at the most accurate resolution recorded in Darwin Core format: Family, Genera, Species, Morphotype)  
**Live and dead coral cover and areal extent** (percentage of living and dead coral on available substrate and the total spatial footprint)  
**Density and Abundance? Total habitable substrate** (structural complexity such as rugosity)

\*bare minimum

## SUPPORTING VARIABLES

**Temperature** ([sea surface temperature](#), [subsurface temperature](#))  
**Salinity** ([sea surface salinity](#), [subsurface salinity](#))  
**Turbidity** ([ocean colour](#), [dissolved organic carbon](#), [particulate matter](#))  
**pH** ([oxygen](#))  
**Total alkalinity** ([stable carbon isotopes](#))  
**Dissolved inorganic carbon (DIC)** ([inorganic carbon](#), [transient tracers](#))  
**Herbivory & reef EOVs** ([macroalgal canopy cover & composition](#), [fish abundance & distribution](#))

## DERIVED PRODUCTS

**Coral cover, areal extent and habitat mapping** (GIS mapped layers/grid cells)  
**Coral health and condition inventory** (disease prevalence, overall condition)  
**Coral diversity and recruitment inventory** (taxonomic, size-class diversity etc.)  
**Coral reef habitat classification inventory** (e.g., patch, low relief, high relief, etc.)  
**Coral reef system health assessment** (inclusive of fish and macroalgae EOVs)  
**ESA and Red List species inventory** (focus on species of conservation concern)  
**Habitat risk mapping** (e.g. temp., pH, turbidity, areas at risk of eutrophication, etc.)

## 2. Phenomena to observe - what we want to observe with this EOVS

This section presents an example of **3 priority phenomena** for GOOS that can be (partly) characterised by this EOVS's sub-variables. This list is not exhaustive but serves to provide general guidance on how observation efforts can structure their planning and implementation.

The GOOS application area(s) relevant to the phenomena are depicted as follows: **climate** , **ocean health**  & **operational services** 

PHENOMENA TO OBSERVE		Reef Status and Trends 	Extreme events and mass mortality  	Community recovery and regeneration 
PHENOMENA EXTENT	HORIZONTAL	<p><b>Local, regional, and global Warm-water corals</b> (0–40 m, SCUBA-accessible, typically tropical)</p> <p><b>Cold-water corals</b> (&gt;40 m, from mesophotic to deep-sea, ROV/AUV accessible, tropical to polar)</p>	Local to regional	Local to regional
	VERTICAL	<p><b>Upper to deep-ocean</b>, integrating shallow SCUBA surveys (0–40 m) and deep-sea imaging (&gt;40 m)</p> <p><b>Warm-water</b> (coastal reefs)</p> <p><b>Cold-water</b> (continental shelves, slopes, seamounts, canyons)</p>	Upper to deep-ocean	Upper to deep-ocean
	TEMPORAL	Years to decades	<p><b>Days to weeks to 2-3 years</b> (dependent on whether short episodic events or larger scale, monitoring should be event-based)</p>	<p><b>Weeks to months</b> (short-term recovery) to <b>months to years</b> (long-term recovery)</p>

<b>RESOLUTION TO OBSERVE PHENOMENA</b>	<b>HORIZONTAL</b>	<b>Local</b> (1-20m, high-res SCUBA or ROV imaging) to <b>regional</b> (20-200m, remote sensing, sonar) to <b>global</b> (>200m, global synthesis)	<b>Local</b> (1-20m) to <b>regional</b> (20-100m)	<b>Local</b> (1-20m) to <b>regional</b> (20-100m)
	<b>VERTICAL</b>	<b>Upper-ocean</b> (1-30) <b>Mesophotic</b> (30-200) <b>Deep-ocean</b> (>200m)	<b>Upper-ocean</b> (1-30) <b>Mesophotic</b> (30-200) <b>Deep-ocean</b> (>200m)	<b>Upper-ocean</b> (1-30) <b>Mesophotic</b> (30-200) <b>Deep-ocean</b> (>200m)
	<b>TEMPORAL</b>	<b>Yearly</b> (for 10+ years)	<b>Quarterly to yearly</b>	<b>Yearly</b> (or depending on recovery trajectory)
<b>SIGNAL TO CAPTURE</b>		<b>1-2%</b> annual change	<b>&gt;10%</b> change in coral coverage/composition	
<b>SUB-VARIABLES NEEDED TO MEASURE</b>		<ol style="list-style-type: none"> <li>1. Coral condition and health</li> <li>2. Coral diversity</li> <li>3. Live coral cover and areal extent</li> <li>4. Total habitable substrate</li> </ol>	<ol style="list-style-type: none"> <li>1. Live coral cover and areal extent</li> </ol>	<ol style="list-style-type: none"> <li>1. Coral condition and health</li> </ol>
<b>SUPPORTING VARIABLES NEEDED TO MEASURE</b>		<b>Temperature</b> ( <a href="#">sea surface temperature</a> , <a href="#">subsurface temperature</a> ), <b>turbidity</b> ( <a href="#">ocean colour</a> , <a href="#">dissolved organic carbon</a> , <a href="#">particulate matter</a> ), <b>herbivory &amp; reef EOVs</b> ( <a href="#">macroalgal canopy cover and composition</a> , <a href="#">fish abundance &amp; distribution</a> ), <b>dissolved inorganic carbon (DIC)</b> ( <a href="#">inorganic carbon</a> )	<b>Temperature</b> ( <a href="#">sea surface temperature</a> , <a href="#">subsurface temperature</a> ), <b>salinity</b> ( <a href="#">sea surface salinity</a> , <a href="#">subsurface salinity</a> ), <b>turbidity</b> ( <a href="#">ocean colour</a> , <a href="#">particulate matter</a> ), <b>pH</b> ( <a href="#">oxygen</a> ), <b>total alkalinity</b> ( <a href="#">stable carbon isotopes</a> ), <b>herbivory &amp; reef EOVs</b> ( <a href="#">macroalgal canopy cover &amp; composition</a> , <a href="#">fish abundance &amp; distribution</a> )	<b>Temperature</b> ( <a href="#">sea surface temperature</a> , <a href="#">subsurface temperature</a> ), <b>salinity</b> ( <a href="#">sea surface salinity</a> , <a href="#">subsurface salinity</a> ), <b>pH</b> ( <a href="#">oxygen</a> ), <b>total alkalinity</b> ( <a href="#">stable carbon isotopes</a> ), <b>dissolved inorganic carbon (DIC)</b> ( <a href="#">inorganic carbon</a> ), <b>herbivory &amp; reef EOVs</b> ( <a href="#">macroalgal canopy cover &amp; composition</a> , <a href="#">fish abundance &amp; distribution</a> )

# 3. GOOS Observing Specifications or Requirements

This section outlines ideal measurements for an optimal observing system for this Essential Ocean Variable (EOV). It offers guidance on creating a long-term system to observe key phenomena related to the EOV. These values are not mandatory, and no single system is expected to meet all requirements. Instead, the combined efforts of various observing systems should aim to meet these goals. Observations at different scales are also valuable contributions to global ocean observation if shared openly.

<b>EOV</b>	<b>Coral cover and composition</b>							
<b>PHENOMENA</b>	<b>Reef status and trends</b> (measured by all sub-variables) <b>Extreme events and mass mortality</b> (measured through live coral cover and areal extent) <b>Community recovery and regeneration</b> (measured by coral condition and health)							
<b>EOV SUB-VARIABLES</b>	<b>Coral condition and health</b>				<b>DEFINITION</b>	<b>Coral condition and health</b> describes the <b>current state</b> of coral colonies by measuring indicators such as [% tissue death, % mortality, % damage]. These provide insight on environmental/anthropocentric impacts on coral stress and resilience.		
	<b>Resolution</b>				<b>Uncertainty Measurement</b>	<b>Stability</b>	<b>Sampling approach</b>	<b>References</b>
	<b>Spatial Horizontal</b>	<b>Spatial Vertical</b>	<b>Temporal</b>	<b>Timeliness</b>

# 5. Data and information management

Access to data and information is at the core of an ocean observing system. This section provides essential information on how to contribute data to the GOOS

GOOS approach to data management is aligned with open data and FAIR (Findable, Accessible, Interoperable, Reusable)<sup>1</sup> practices. All EOVS data and information is valuable, thus effective data management practices are essential to ensure it remains accessible and (re)usable for future generations.

In this section you will be directed to resources that explain how you can contribute data to global ocean observing and ensure your data and information is accessible, interoperable and sustained. This resource has instructions for different scenarios: an individual submitting data, or existing data centres connecting to the system.

**Please follow these practices carefully, as BioEco EOVS data FAIRness relies on compliance with these guidelines.**

Before proceeding, please note these important points:

1. As a **minimum**, you must ensure information describing your EOVS data (i.e. metadata) are visible in the [Ocean Data and Information System \(ODIS\)](#)<sup>2</sup>. Regardless of where the actual data is stored, evidence of its existence must be findable within ODIS.
2. BioEco EOVS data is successfully managed if it is discoverable in the [GOOS BioEco Portal](#). The BioEco Portal is the central point of access and coordination of BioEco EOVS observing programmes. Data visible in ODIS will automatically be visible in the BioEco Portal and vice versa.
3. If data is published to OBIS<sup>3</sup>, it will also be visible in ODIS and the BioEco Portal. You do not need to also add it elsewhere, unless there is extra information you would like to include.

The main data management steps are as follow:

1. Become discoverable: ensure the data producers (e.g., organisation, programme, project, etc.) and datasets are visible in ODIS
2. Prepare the required metadata about the data producer and the datasets
3. Publish EOVS data (e.g. OBIS)
4. Verify discoverability in ODIS

Not all steps may be relevant for you, but **Step 1 is the minimum required** to ensure your data contributes to EOVSs.

---

<sup>1</sup> Wilkinson et al. 2016 <https://doi.org/10.1038/sdata.2016.18>

<sup>2</sup> ODIS, part of IOC-UNESCO's International Oceanographic Data and Information Exchange (IODE), is a global federation of data systems sharing interoperable (meta)data about holdings, services, and other resources to enhance cross-domain data accessibility.

<sup>3</sup> OBIS is a global biodiversity database and IOC-UNESCO IODE component, connecting +30 nodes, +1000 institutions, and 99 countries, interoperating with other major biodiversity hubs like GBIF and makes data visible in ODIS as an ODIS node.

**TO CONTRIBUTE DATA AND METADATA TO THE GLOBAL OBSERVING SYSTEM, PLEASE GO TO: <https://iobis.github.io/eov-data-management/>**

Figure 2. Map of OBIS Nodes. See <https://obis.org/contact/> for a complete list.

Contact the OBIS Secretariat ([helpdesk@obis.org](mailto:helpdesk@obis.org)) for help setting up your data workflows. To publish BioEco EOVS data from systems like NCEI or ERDDAP to OBIS, consider becoming an OBIS node or [collaborating with one](#). The OBIS Secretariat can help guide you through [the process of becoming a Node](#), or connect you with an appropriate OBIS node (Figure 2).

# Acronyms and Abbreviations

**CBD:** Convention on Biological Diversity

**EBV:** Essential Biodiversity Variables

**ECV:** Essential Climate Variables

**EOV:** Essential Ocean Variables

**GCOS:** Global Climate Observing System

**GEO BON:** Group on Earth Observations Biodiversity Observation Network

**GOOS:** Global Ocean Observing System

**IOCCP:** International Ocean Carbon Coordination Project

**MBON:** Marine Biodiversity Observation Network

**OBIS:** Ocean Biodiversity Information System

**ODIS:** Ocean Data Information System

**OCG:** Observation Coordination Group

**OOPC:** Ocean Observations Physics and Climate Panel

**SDG:** Sustainable Development Goals

# Glossary of terms

**Derived products:** outputs calculated from the EOV and sub-variables, often in combination with the supporting variables, that contribute to evaluating change in phenomena. For example, evaporation can be determined from sea surface temperature measurements; air-sea fluxes of CO<sub>2</sub> can be derived from inorganic carbon EOV; fish stock productivity can be determined from fish abundance.

**Indicators:** An indicator can be defined as a 'measure based on verifiable data that conveys information about more than just itself'. This means that indicators are purpose dependent - the interpretation or meaning given to the data depends on the purpose or issue of concern. (BIP definition)

**Measurement Uncertainty:** the parameter, associated with the result of a measurement, that characterises the dispersion of the values that could reasonably be attributed to the measurand (GUM)<sup>1</sup>. It includes all contributions to the uncertainty, expressed in units of 2 standard deviations, unless stated otherwise

**Phenomena:** properties (e.g., of a species such as distribution), processes (e.g., of the ocean such as surface ocean heat flux), or events (e.g., such as algal blooms) that have distinct spatial and temporal scales, and when observed, inform evaluations of ocean state and ocean change

**Stability:** The change in bias over time. Stability is quoted per decade.

**Supporting variables:** other measurements that are useful to provide scale or context to the sub-variables of the EOV (e.g., pressure measurements to provide information on the depth at which subsurface currents are estimated, sea temperature to understand dissolved inorganic carbon, water turbidity to support estimations of hard coral cover ).

**Sub-variables:** key measurements that are used to estimate the EOV (e.g., counts of individuals to provide an estimate of species abundance (such as fish, mammals, seabirds or turtles), partial pressure of carbon dioxide (pCO<sub>2</sub>) to estimate ocean inorganic carbon, or wave height to estimate sea state).

**Timeliness:** The time expectation for availability of data measured from the data acquisition time.

## Appendix - Additional information

### A1. Applications

This table provides examples of applications of this EOVS, including contribution to other essential variable frameworks, multilateral environmental agreements, contribution to indicators and GOOS applications

EOV		
CORRESPONDING ESSENTIAL VARIABLES	ECV	Sea surface temperature, Ocean color
	EBV	Species populations, Ecosystem structure
GLOBAL INDICATORS EOVS CAN CONTRIBUTE	SDG	SDG 14.2.1 (Proportion of degraded reefs) SDG 14.5 (Marine protected area coverage)
	CBD	Aichi Target 10 (Coral vulnerability reduction)
	CLIMATE	Reef heat stress alerts (NOAA Coral Reef Watch)
	OTHER	Ocean Health: Reef Resilience Index, IUCN Red List assessments
GOOS APPLICATIONS
